DISCLAIMER**:** This narrative is our take on an original happening and does not claim to represent factual events, legal truths, or the actual circumstances of any real-world cases. It is a work of theory and storytelling.

THE ISLAND FILES: THE DEAD FINANCIER

Story Background:

The world was told that The Financier took his own life in the most secure federal facility in the USA . But the logs don't add up. You have intercepted a "dead man's switch" application: The Island Files, sent by an anonymous whistleblower inside the prison.

On the night of August 10th, the security system suffered a "synchronized failure." Three powerful associates were present. The Asset, a fellow high-profile prisoner who acted as the Financier's gatekeeper, was seen moving between wings despite being on lockdown. The Governor, desperate to hide his campaign donor list, and The Duke, fearing a public scandal, were both "visiting" the wing during the blackout.

As you navigate the APK, you are uncovering the clues. Only when all 6 Island{} flags are found will you see who moved the cameras, who drugged the guards, and who ultimately made sure that the Financier never spoke

Instructions Guide:

1. The goal is to find who killed the Financier, where he was killed and the weapon that was used.
2. The flags you find will provide you with the clues to find the murderer.
3. There are 6 clues(flags) in total.
4. The grid you see on the entry screen is just for your use. It is used for eliminating possibilities or to mark your doubts after you find the clues (flags). The grid has nothing to do with finding the flags, It will help you to confirm the murderer. Don't waste your time to find the flags here.
5. Buttons:
    a. ACCESS INFORMATION: Gives you details about the suspects, locations, and weapons
    b. CLUES AND EVIDENCE: This leads to the actual challenges. Each of the challenges contains only 1 flag. No flags are in parts.
    c. MAKE ACCUSATION: After you find the murderer, location and weapon used, you can verify it here. You can bruteforce different combinations here to find the murderer, but again, it is of no use as it isn't related to any challenge. You will get extra points, that's all.

So, only CLUES AND EVIDENCE leads to challenges. Other parts of the app are related to the game(If you're familiar with Murdle, it is the same format).

Flag Format: Island{<clue>}

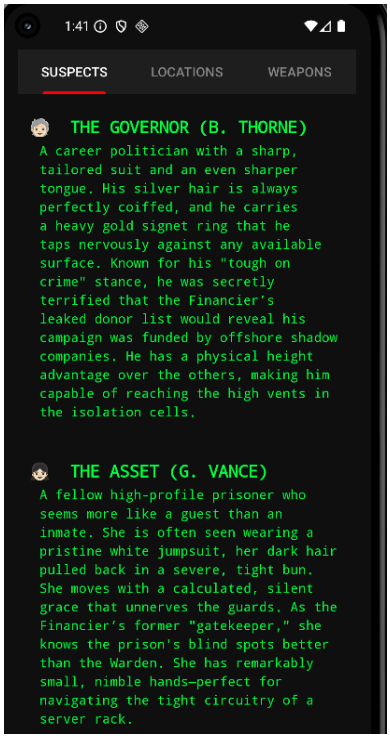
When you solve a challenge, you won't get the flag directly. Submit the key you get in the challenge screen to get the actual flag. With these clues, you can find the murderer.

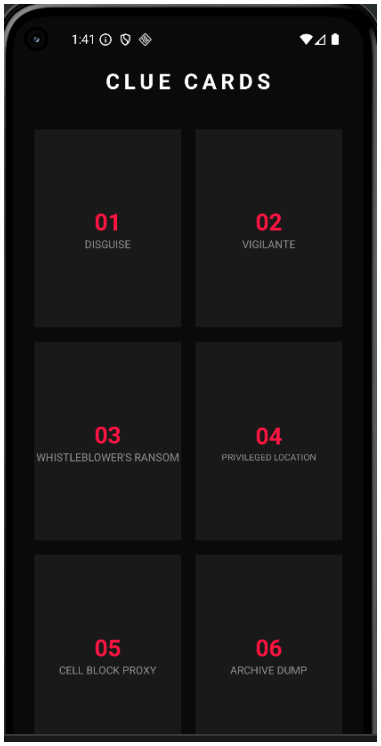
Scoring:

Flags: 20 per flag (20 x 6)

Solving the puzzle: 30

Total: 150





HINTS:

1. **DISGUISE**

   Want the key? Disguise as FRIEND_OF_KILLER. Maybe an imposter will give you the key!

   [Hook to the function as a new identity]

2. **VIGILANTE**

   Try to intercept the communication between app and vigilante. You somehow have to prove yourself as the original app as well

   [Use Burpsuite or curl]

3. **THE WHISTLEBLOWER'S RANSOM:**

   A whistleblower has intercepted the killer's GPS coordinates, but she's gone into hiding. She demands a massive transfer of BoneCoin (BNE) to fund her disappearance ($2,147,483,647 in USD)

The current market price is $1,000,000 USD per 1 BNE.

You only have $500 USD in your account. You can't afford even a fraction of a coin, unless you can trigger a **Negative Invoice**.

[Look where the associated transaction function is. Integer is 32 bits]

4. PRIVILEGED LOCATION

Move to a privileged location to get this clue. But wait! only moving moving won't help. You have to get the right permission, only then can the Feds give you information!Move to a privileged location to get this clue. But wait! only moving moving won't help. You have to get the right permission, only then can the Feds give you information!

Check if the app requested for the permission. Since the app is rooted, you have right to move the app to any location. Move the app to a privileged location to get access to the permission.

[Use Magisk or Frida]

5. CELL BLOCK PROXY

The 'Public Messenger' is efficient but dangerously trusting. It accepts any parcel, no matter who it's from, and delivers it to whatever place is written on the label. It doesn't realize it’s being used as a proxy to open doors that should stay locked. If you can give the right 'Target Room' to it ,it’ll lead you straight into the hiding place which has the evidence.

[Broadcast Intent Redirection. Look at AndroidManifest.xml to see if anything is interesting]

6. ARCHIVE DUMP

The Archive was supposed to be wiped, but the system's 'Mirroring Protocol' was too fast. While the glass screen shows you a 'Corruption Error,' the actual data was whispered into the shadows of the application’s private ledger.

[Insecure Data Storage in SharedPreferences]
